V3.08e Notes

Not too much here, I had been hanging on to see if there might be something easy to put in to help with the bricked boxes but as of now it doesn't look like the server code can help,

1) Audio Only Mode is now supported. Use Resolution=0 to enable it.
2) The remote handling code has been enhanced to support very fancy HTML coded remotes. We can now load pictures of remotes and have active buttons. Just like the good ol' days. Thanks Andy, Pfuller and RandomMan for all your time helping to get this going. For the really brave the code will support running PHP scripts (if you've got a php interpreter available on your host). We only have two now but hopefully more to come. Grab the .zip file from the CustomRemote folder and unzip it where the server code is located. You should see a .html file and a new folder which has supplementary files for the new remote. In your config file point the "Remote" to the unzipped html file and you should be good to go.
3) I trimmed on average another ¼ second off the time the code takes to respond to remote button clicks.
